Accelerating beneficial AI through MeTTa innovation.

This competition, powered by SingularityNET.io on BASIX.MARKET in conjunction with BGI Comms, is designed to accelerate the development of beneficial AI through MeTTa innovation. All participants on a team will have opportunities to contribute to the future of decentralized AI.

Student Registration

<https://basix.market/lms/hackathon/1#register>

Cash prizes

Winners will receive cash prizes.

5 teams advance to CodeSlayer 2K26

5 teams will be chosen to enter DevSphereIndia's hackathon, CodeSlayer 2K26, scheduled for 24th & 25th October 2026.

A pathway past the weekend

Find work in the new BASIX.Market Job Portal and the iCog Virtual Internship program — and join our BGI Comms community and other announced partners.

30%

AGI Potential

20%

Implementation Quality

20%

Documentation & Demo

The Glass Box Agent.

Most AI today is a black box you're asked to trust. This track builds agents that are the opposite — every decision comes with a visible reasoning trail, built on Omega's auditable-reasoning model and MeTTa's symbolic logic.

IT'S FUTURISTIC

This is the difference between AI that gives answers and AI that can be held accountable for them — a real requirement for any AI that touches money, healthcare, or governance.

THE CHALLENGE — CHOOSE ONE

- 01 An agent that makes a resource-allocation decision (funding, credit, access) and produces a step-by-step justification a non-technical person could follow and challenge.
- 02 A “show your work” reasoning agent that can be interrupted mid-decision and asked “why?” — and answers by tracing back through its own logic, live.
- 03 A dispute-resolution agent that takes two conflicting claims and reasons out loud to a resolution, showing every inference it made along the way.

DELIVERABLE

Working agent + a sample “reasoning transcript” + 3-min video demoing a live challenge to the agent's decision.

The Agent That Grows Up.

Static AI knows what it was trained on. This track builds a small agent that starts with a limited rule/knowledge set and visibly evolves — updating its own MeTTa rules as it encounters new information, with Omega-style persistence so it remembers what it learned across sessions.

WHY IT'S FUTURISTIC

This is a small, safe taste of self-modifying AI — one of the most talked-about and least-demonstrated capabilities in the field, made concrete enough to actually finish in two days.

THE CHALLENGE — CHOOSE ONE

- 01 An agent that starts with a wrong or incomplete belief, gets corrected, and shows the literal diff between its old rule and its new rule.
- 02 A community-knowledge agent that starts empty and builds up a local knowledge base from repeated interactions — e.g., a campus helper that gets smarter about a specific campus over a week of use.
- 03 An agent that flags its own uncertainty, asks a clarifying question, and permanently updates its rule set based on the answer.

DELIVERABLE

Working agent + before/after rule diff + 3-min video showing it learn something live.

Omega AI Agents.

What's actually cool about Omega/MeTTa — auditable reasoning, self-modifying agents, stateful memory, neural-symbolic logic — each wrapped in a story/product hook instead of a bug-fix exercise.

LEVELS 1, 2 & 3 · THREE TRACKS

TRACKS AT THIS LEVEL

- 01 Two Agents, One Truth
- 02 The Agent Without Borders
- 03 BASIX.Market — Mature Build

OMEGA EVALUATION CRITERIA

30%

Innovation & Creativity

30%

Technical Implementation

20%

Sustainability Impact

20%

Documentation & Presentation

Two Agents, One Truth.

A pair of agents that have to reconcile disagreeing beliefs about the same fact — one says X, the other says Y — and they have to run a small negotiation/reasoning protocol to resolve it and explain how they got to an answer both can live with.

A fun multiplayer-feeling build — two small agents “arguing” it out — that taps into the neural-symbolic reasoning identity of Omega without needing the full multi-agent chat infrastructure.

ALL FOUR

- 01 Have a strong one-line pitch a judge or a sponsor would remember.
- 02 Are scoped to “one small agent, one clear behavior” — doable by a 1–2 level student in 2 days.
- 03 Use MeTTa’s actual identity (reasoning, self-modification, memory, symbolic logic) as the feature, not as homework.

The Agent Without Borders.

This track combines the Global AI Access theme with Omega/MeTTa reasoning — building agents that don't just translate, but reason in a way that holds up across languages, literacy levels, and connectivity constraints.

WHY IT'S FUTURISTIC

It reframes "AI for accessibility" from a translation problem into a reasoning problem — building trustworthy AI that actually works for the 4 billion people who aren't in Silicon Valley's default use case.

THE CHALLENGE — CHOOSE ONE

- 01 A reasoning agent that explains its own decisions in a local language (not just translated output, but reasoning steps generated to be understandable to a non-English, non-technical user).
- 02 A low-bandwidth/offline-first agent that makes a decision locally with a small MeTTa rule set, then reconciles with a fuller Omega-style agent when connectivity returns — and shows how its answer changed and why.
- 03 An accessibility-first reasoning agent that adapts its explanation style (voice, simplified text, visual) to the user, while keeping the same underlying reasoning trail.

DELIVERABLE

Working agent + a short explanation of how it adapted to language/access constraints + 3-min video.

BASIX.Market — Mature Build Track.

This track expects more finished output than Tracks 1–2, since it's meant to plug into an actual product. Build a working feature or module for the future BASIX NFT Marketplace, such as:

01

Ownership

A simple ownership/fractional-share tracking prototype.

02

Phigital

A basic phigital (physical + digital) asset listing flow.

03

Creators

A creator-onboarding mini-tool for local artists/entrepreneurs.

Next Level Devs.

High Level Developed tracks — experienced teams with a real-world commercial angle, & gaming.

ADVANCED · REAL-WORLD · GAMING

TRACKS AT THIS LEVEL

01 The Agent That Can Be Trusted With Money

02 The NPC That Won't Break Character

WHO IT'S FOR

For teams with prior competition experience, or that have competed in a hackathon or Sprint.

Judged partly on “would a real business trust this,” not just “does it work.”

The Agent That Can Be Trusted With Money.

Financial and business decisions need reasoning you can audit after the fact — not just an output, but a defensible trail of why. This track asks teams to build an agent that makes a real (small-scope) business decision and produces an audit trail good enough that a skeptical manager, auditor, or investor could actually follow it.

WHAT RAISES THE BAR VS. THE BEGINNER TRACKS

- Must handle at least one case of incomplete/conflicting input data and explain how it handled the gap.
- Must produce a justification a human reviewer could act on to override the agent's decision.
- Judged partly on “would a real business trust this,” not just “does it work.”

THE CHALLENGE — CHOOSE ONE

- 01 A vendor/quote comparison agent that picks between 3–4 options and produces a reasoning chain justifying the pick (cost, risk, fit) that a non-technical stakeholder could read and challenge.
- 02 A micro-lending/fractional-ownership approval agent (BASIX-flavored) that decides whether a small transaction should be approved, with a full justification trail and a clearly stated confidence level.
- 03 A pricing/discount agent that has to explain, line by line, why it approved or rejected a specific deal.

DELIVERABLE

Working agent + a one-page “audit trail” sample output + 3-min video pitched as if to an actual business owner.

The NPC That Won't Break Character.

Every game NPC eventually says something dumb because it has no real memory or reasoning — this track is about building an NPC/game agent with actual persistent memory and consistent internal logic, so it reacts differently to a player it's seen before versus a stranger, and never contradicts its own established facts.

WHAT MAKES IT A STRONG TRACK

- Playable-feeling output (even a simple text/chat interface is fine — think interactive fiction, not full game engine).
- Memory has to visibly change behavior in-session (not just “remembered but ignored”).
- Bonus: NPC can be “wrong” (acting on a rumor that isn't true) and this should feel like a feature, not a bug.

THE CHALLENGE — CHOOSE ONE

01 Quest-giver NPC

Remembers what the player has already done, references it unprompted, and refuses to repeat a quest it already gave out.

02 Rival / companion character

Keeps a consistent opinion of the player based on past interactions, and can explain why it feels that way if asked.

03 “World knows about you” agent

An in-game character who's heard rumors about the player's past actions from other characters and reacts accordingly, sourcing which “NPC” told them what.

DELIVERABLE

Working demo (text interface is fine) + a short “play session” transcript showing memory affecting behavior + 3-min video demoing it live with a judge or teammate playing along.

Build the AI Infrastructure Layer.

This is not a classroom exercise. Teams work inside their github url. They keep working on github and submit their github url by the end of the hackathon. As a live MVP environment (GitHub), using SingularityNET's Omega agent infrastructure — a neural-symbolic agent framework on the Hyperon AGI stack built for stateful agents with auditable reasoning and long-term persistence — to design real tools for universities, businesses, and community ecosystems.

ELIGIBILITY

Open to students who have completed a prior MeTTa track, completed or have BASIX.Market coursework.

THE CHALLENGE

How can AI agents help universities, businesses, and communities scale faster? Choose one:

01 Dev/Scale Support

Onboarding, CRM support, automation, reporting, customer service, ops, or lead qualification tools for small businesses.

02 Fractional CTO Agent

AI-assisted technical planning, product roadmaps, vendor evaluation, dev briefs, or MVP planning.

03 RWA / Digital Asset Infrastructure

Managing, documenting, or activating real-world assets, cultural IP, student projects, public art, sponsorship assets, or tokenized proof-of-value.

They enter the same infrastructure pipeline we use with businesses.

Experience: Assess → Onboard → Build → Submit → Review → Showcase → Continue.

WHAT WE CAPTURE — CASE STUDY METRICS

- Students onboarded

- Schools activated

- Teams formed

- Agent ideas created

- MVP workflows tested

- Mentor / reviewer feedback

- Student outcomes

- Business use cases generated

SECTION 03

03

20%

Team collaboration & documentation

Deliverables should be closer to a working alpha than an experiment — tracks are judged more on usability and completeness than on non-functional ideation.

Day 1 • September 30 — Kickoff & Build.

September 30 – October 1: On-Campus Build · October 2: Polish, Record & Submit · Daily hours 10:30 AM – 6:00 PM
Host live through every build block · Help Desk running adjacent to the Live stream, Virtual track, and on BASIX.Market

10:30 – 10:45 AM	Welcome & Opening Host opens live stream, welcomes Live (SJIT campus) + Virtual (incl. Kenyatta University of Engineering) participants
10:45 – 11:00 AM	Mentor Introductions Host announces all mentors online for the event, and how/when to reach them
11:00 – 11:20 AM	Track Briefing Walkthrough of all tracks, rules, judging criteria, submission requirements
11:20 – 11:30 AM	Team Check-in Confirm team rosters (3–4 members), track selection locked in
11:30 AM – 1:00 PM	Build Block 1 Host live on stream; mentors circulate (live + virtual); Help Desk open
1:00 – 2:00 PM	Lunch Break
2:00 – 3:30 PM	Build Block 2 Host live on stream; Help Desk open
3:30 – 3:45 PM	Tea Break
3:45 – 5:15 PM	Build Block 3 Host live on stream; Help Desk open
5:15 – 5:45 PM	Day 1 Mentor Office Hours Optional drop-in for stuck teams, live + virtual
5:45 – 6:00 PM	Day 1 Wrap-Up Host recaps progress, previews Day 2 start time

Day 2 • October 1 — Build & Finish Strong.

September 30 – October 1: On-Campus Build · October 2: Polish, Record & Submit · Daily hours 10:30 AM – 6:00 PM
Host live through every build block · Help Desk running adjacent to the Live stream, Virtual track, and on BASIX.Market

10:30 – 10:45 AM	Day 2 Kickoff Host re-opens stream, mentors re-announced as online
10:45 AM – 12:30 PM	Build Block 4 Host live on stream; Help Desk open
12:30 – 1:30 PM	Lunch Break
1:30 – 3:00 PM	Build Block 5 Host live on stream; Help Desk open
3:00 – 3:15 PM	Tea Break
3:15 – 4:45 PM	Build Block 6 Host live on stream; Help Desk open
4:45 – 5:00 PM	Tea Break
5:00 – 5:45 PM	Final Mentor Office Hours Last chance for guidance before on-site time ends
5:45 – 6:00 PM	Closing Announcement Host reminds all teams: the on-campus portion is complete; October 2 is for polish, video recording, and submission — final submission (code + docs + 3-min video) due by midnight October 2.

October 2 — Polish, Record & Submit.

No scheduled campus sessions.

Teams work remotely to finalize their build

Record 3-minute max project video

Submit code repository, documentation, and video

Help Desk remains available on BASIX.Market for last-minute questions

HARD DEADLINE

IST 11:59 PM

October 2

FINAL SUBMISSION

- Code repository
- Documentation
- 3-minute max video

24HR SJIT + SOLO HACKERS

Hard deadline: 10:30AM IST, October 1st

The Omega Overnight 24HRS.

The 24 HR Teams Live At SJIT On Campus + Solo Hackers

Open to teams staying on-site overnight — one continuous 24-hour build, one working feature. Every other track lets teams choose Omega, MeTTa, or both. **This one doesn't.** If you're staying overnight, you're building on Omega — full stop. The trade-off for the harder overnight hours is a tighter, sharper scope: **you're not shipping a platform, you're proving one idea works.**

HARD REQUIREMENTS

■ Built on Omega, not optional.

Some visible piece of Omega's stateful, auditable-reasoning architecture has to be the actual feature — not decoration.

■ AI Disclosure — mandatory.

Every submission includes a short, plain statement of which AI tools or models the team used during the build and how — e.g. "Claude for code review and debugging," "GPT-5 for boilerplate scaffolding," "Omega's own inference for the agent's reasoning loop." This isn't a penalty — AI-assisted building during an overnight sprint is expected. Undisclosed use, if discovered, is a disqualifying integrity issue; disclosed use is not.

No team attempts a complete platform. One feature, proven, is the whole assignment.

SOLO HACKERS must join the 24 HR Track

THE CHALLENGE — CHOOSE ONE

- 01 One agent producing an auditable decision
- 02 One agent learning and updating a rule
- 03 Two agents resolving one conflicting claim
- 04 One NPC demonstrating persistent memory
- 05 One BASIX workflow completing a defined business task

DELIVERABLE — DUE 10:30 AM SHARP

- Working GitHub repository shared with BASIX.Market
- Short README: problem, solution, technology, plus the AI Disclosure statement
- One functioning Omega feature
- Sample reasoning transcript, memory record, or audit trail
- 3-minute demonstration video
- Short statement of what the team would build next

24 hours. One feature.

SJIT 24 HR SOLO HACKATHON · BASIX.MARKET · Time IST, Sept 30th – October 1st.

SOLO HACKERS must join the 24 HR Track

TIME IST · SEPT 30TH		TIME IST · OCTOBER 1ST	
10:30–11:00 AM	Opening, partner welcome and hackathon purpose	12:00–12:30 AM	Midnight technical checkpoint
11:00–11:30 AM	Tracks, rules, judging and submission briefing	12:30–3:30 AM	Build Block 5: testing and problem-solving
11:30 AM–12:00 PM	Confirm teams and lock track selection	3:30–4:00 AM	Break
12:00–2:00 PM	Build Block 1: define problem, user and technical approach	4:00–6:30 AM	Build Block 6: complete core functionality
2:00–2:45 PM	Lunch	6:30–7:15 AM	Breakfast
2:45–5:30 PM	Build Block 2: establish repository and working foundation	7:15–8:30 AM	Documentation, repository cleanup and audit trail
5:30–6:00 PM	Checkpoint 1: team lead reports progress and blockers	8:30–9:30 AM	Record three-minute demonstration video
6:00–8:30 PM	Build Block 3: core feature development	9:30–10:00 AM	Final upload and submission checks
8:30–9:15 PM	Dinner	10:00–10:30 AM	Closing, team acknowledgments and next-step briefing
9:15 PM–12:00 AM	Build Block 4: integration and first working demo	10:30 AM	Hard submission deadline

JUDGING PLAN	
We do not require international judges to assess everything during the 24-hour build.	
1	10:30 AM–2:00 PM IST BASIX and technical staff verify eligible submissions.
2	2:00–6:00 PM IST Judges receive repositories, documentation and three-minute videos.
3	7:30–9:00 PM IST Virtual finalist presentations. This is approximately 10:00–11:30 AM IST Time.
4	Winners at SJIT are announced in the morning by the school.

SCORING REMAINS THE SAME		
30%	Technical execution	
25%	Working demonstration	
25%	Fit with Omega/MeTTa/BASIX	
20%	Team collaboration and documentation
