

SJIT CHENNAI + KU VIRTUAL · SEPT 30 – OCT 2, 2026 · BASIX.MARKET

The Hackathon, Explained.

SingularityNET × Omega × BASIX.Market
Building beneficial AI with MeTTa & Omega

2 + 1

build days + submit day

3-4

members per team

5

teams advance to CodeSlayer 11:59 PM IST deadline

Oct 2

A complete, plain-language guide to the official 35-slide brief:
what the event is, every track and challenge, what to submit,
how you're judged, the full schedules, and how to prepare.

Solo hackers & 24-hr track: hard deadline 10:30 AM IST, October 1.

Prepared Sept 26, 2026 from the organisers' brief. Where the brief is unclear, this guide says so.

The whole thing in one minute

This is a student hackathon run by **BASIX.Market** and powered by **SingularityNET**. Your job is to build a small but *working* AI agent using two SingularityNET technologies, **MeTTa** and **Omega**, and to show it off in a short video. The theme is “**beneficial AI**”: agents whose reasoning you can see, question, and trust.

- **When:** Sept 30 – Oct 2, 2026. Two build days, then one day to polish, record and submit. That is **4 days from today** (Sept 26).
- **Where:** Live at **SJIT College, Chennai** (10:30 AM – 6:00 PM daily, filmed) or virtually with **Kenyatta University** (Kenya).
- **Who:** Teams of 3–4. Each team picks **one** track. Solo hackers must do the 24-hour overnight track.
- **What you hand in:** a GitHub repo shared with BASIX.Market, short documentation, and a video of 3 minutes max.
- **What you can win:** cash prizes; 5 teams go on to **CodeSlayer 2K26** (Oct 24–25); plus access to the BASIX job portal and iCog virtual internship.
- **How you're judged:** 30% technical execution · 25% video/demo · 25% fit to track · 20% teamwork & docs.

The single most important idea

Judges want a **working alpha, not an experiment**. A small agent that clearly does one thing well and shows its reasoning will beat an ambitious idea that doesn't run. Several slides repeat this: “one small agent, one clear behaviour” and “one feature, proven, is the whole assignment.”

Key terms decoded

Term	What it means for you
SingularityNET	The main technology partner. A decentralised-AI organisation founded by Dr. Ben Goertzel (who is also listed as a judge).
MeTTa	A symbolic programming language from SingularityNET's Hyperon AGI stack. You write facts and rules; it reasons over them. Because the rules are explicit, you can show <i>why</i> an answer was reached, and the program can even rewrite its own rules.
Omega	SingularityNET's agent framework, described in the brief as a <i>neural-symbolic</i> framework on the Hyperon stack, built for stateful agents with auditable reasoning and long-term memory .
Hyperon	SingularityNET's broader AGI software stack that MeTTa and Omega belong to.
Neural-symbolic	Mixing neural AI (e.g. LLMs, pattern-matching) with symbolic AI (explicit logic rules). The symbolic part is what makes reasoning traceable.
BASIX.Market	The host platform. Registration, the help desk and submissions all go through it. Also building an NFT marketplace (relevant to one track).
BGI Comms	"Beneficial General Intelligence" community partner; runs the BGI Comms+ help desk.
iCog Labs	Developers and mentors, some of whom will be on campus.
BeyondTheCode.ai	Documentary / media partner filming the event. Your video may appear on their YouTube.
CodeSlayer 2K26	DevSphereIndia's hackathon on Oct 24–25, 2026. The top 5 teams here get entry.
Phigital	Physical + digital, e.g. a real painting paired with a digital token that represents it.
RWA	Real-World Assets: physical things (art, property, IP) tracked or represented digitally.

SECTION 01

Dates & deadlines

There are two different submission deadlines depending on how you enter. Don't mix them up.

Date (IST)	Regular teams (2-day)	24-hour track & solo hackers
Sat, Sept 26 (today)	Register, form team, set up tools	Register, set up tools
Wed, Sept 30	Day 1 build, 10:30 AM – 6:00 PM	24-hr sprint begins 10:30 AM, runs overnight
Thu, Oct 1	Day 2 build, 10:30 AM – 6:00 PM	HARD DEADLINE 10:30 AM ; judging the same day
Fri, Oct 2	No campus sessions. Polish, record video, submit. HARD DEADLINE 11:59 PM	—

Date (IST)	Regular teams (2-day)	24-hour track & solo hackers
Oct 24-25	CodeSlayer 2K26 for the 5 advancing teams	Same

Registration requirement

Register at **basix.market/lms/hackathon/1#register**. The brief says registration must be completed **with your institution declared**. Do it before Sept 30, not on the morning of.

Four ways to enter

Entry route	Who it's for	Key facts
SJIT On Campus	Teams at SJIT Chennai	In-person with BeyondTheCode.ai filming. The brief calls this the 24-hr on-campus hackathon.
KU Virtual Kenya	Teams from Kenyatta University of Engineering (and special guest DevSphereIndia)	Remote. Same tracks, run as a virtual stream.
Solo Hackers	Individuals without a team	Must join the 24-hour overnight track (Omega only, 10:30 AM Oct 1 deadline).
Create Your Own (Open)	Anyone with their own idea	Build your own concept, but it must use MeTTa + Omega.

Team rules

- Minimum **3**, maximum **4** members per team.
- Each team competes in **one track only**; the track is locked at check-in on Day 1.
- Mixed teams (SJIT + Kenyatta students together) are allowed and encouraged.

Live vs virtual

Every track runs in two streams: a **Live** stream on the SJIT campus and a **Virtual** stream. A help desk runs alongside both and on BASIX.Market for the whole event.

The tracks, one by one

There are four main tracks (with sub-challenges) plus the 24-hour overnight sprint. Each has its own challenge options and deliverable. Pick the one that matches your team's skill.

Track	Level	Sub-tracks / challenges
1 • MeTTa Foundation	Beginner (L-1)	The Glass Box Agent · The Agent That Grows Up
2 • Omega AI Agents	Beginner to intermediate (L-1, 2, 3)	Two Agents, One Truth · The Agent Without Borders · BASIX.Market Mature Build
3 • Next Level Devs	Experienced teams	The Agent That Can Be Trusted With Money · The NPC That Won't Break Character
4 • AI Infrastructure Layer	Advanced, eligibility required	Dev/Scale Support · Fractional CTO Agent · RWA / Digital Asset Infrastructure
5 • Omega Overnight (24 hr)	Solo hackers + overnight teams	Five narrow one-feature challenges, Omega required

TRACK 1 • METTA FOUNDATION • LEVEL 1

MeTTa Foundation

Beginner track that combines Omega's agent ideas (auditable reasoning, memory, self-correction) with MeTTa's symbolic logic. Its own judging weights:

Technical innovation	AGI potential	Implementation quality	Documentation & demo
30%	30%	20%	20%

TRACK 1.1 • AUDITABLE REASONING

The Glass Box Agent

Most AI is a black box you're asked to trust. This track builds the opposite: an agent where every decision comes with a visible reasoning trail, using Omega's auditable-reasoning model and MeTTa's symbolic logic.

In plain words: Build an agent that makes a decision and can show, step by step, exactly why. The “wow” moment is someone challenging the decision in your video and the agent explaining itself. This matters for any AI touching money, healthcare or governance.

Challenge options (pick one)

- **Resource allocator:** decides on funding, credit or access, and gives a step-by-step justification a non-technical person could follow and challenge.
- **“Show your work” agent:** can be interrupted mid-decision with “why?” and answers by tracing back through its own logic, live.
- **Dispute resolver:** takes two conflicting claims and reasons out loud to a resolution, showing every inference.

Deliverable

Working agent + a sample “reasoning transcript” + a 3-min video demoing a live challenge to the agent's decision.

TRACK 1.2 · SELF-EVOLVING KNOWLEDGE

The Agent That Grows Up

Normal AI only knows what it was trained on. This agent starts with a small set of MeTTa rules and visibly evolves, updating its own rules as it meets new information, and remembering what it learned across sessions (Omega-style persistence).

In plain words: Build an agent that learns and you can see the learning. Show the rule before, the correction, and the rule after. It's a small, safe taste of self-modifying AI.

Challenge options (pick one)

- **Correctable agent:** starts with a wrong or incomplete belief, gets corrected, and shows the literal diff between old and new rule.
- **Community-knowledge agent:** starts empty and builds a local knowledge base from repeated use, e.g. a campus helper that gets smarter about your campus.
- **Uncertainty-aware agent:** notices it's unsure, asks a clarifying question, and permanently updates its rules from the answer.

Deliverable

Working agent + a before/after rule diff + a 3-min video showing it learn something live.

TRACK 2 · OMEGA AI AGENTS · LEVELS 1, 2 & 3

Omega AI Agents

Showcases what's distinctive about Omega/MeTTa (auditable reasoning, self-modifying agents, stateful memory, neural-symbolic logic), each wrapped in a product or story hook. Its own judging weights:

Innovation & creativity	Technical implementation	Sustainability impact	Documentation & presentation
30%	30%	20%	20%

Design rules the brief gives for these challenges

- Have a strong one-line pitch a judge or sponsor would remember.
- Scope it to “one small agent, one clear behaviour”, doable by a level 1–2 student in 2 days.
- Use MeTTa's real identity (reasoning, self-modification, memory, symbolic logic) as *the feature*, not as homework.

TRACK 2.1 · OMEGA AI AGENT CHALLENGE

Two Agents, One Truth

Two agents disagree about the same fact: one says X, the other says Y. They run a small negotiation or reasoning protocol to resolve it and explain how they reached an answer both can accept.

In plain words: Two small agents “arguing it out”. It feels multiplayer and shows off neural-symbolic reasoning without needing full multi-agent chat infrastructure. The resolution and its explanation are the product.

TRACK 2.2 · REASONING ACROSS LANGUAGE AND ACCESS

The Agent Without Borders

Combines the Global AI Access theme with Omega/MeTTa reasoning: agents that don't just translate, but reason in a way that holds up across languages, literacy levels and poor connectivity.

In plain words: Build AI that works for people outside the default English, always-online user. This is a strong fit for India. Think Tamil explanations, low-bandwidth use, or voice-first users.

Challenge options (pick one)

- **Local-language reasoner:** explains its decisions in a local language, with reasoning steps written to be understood by a non-English, non-technical user (not just translated output).
- **Offline-first agent:** decides locally with a small MeTTa rule set, then reconciles with a fuller Omega-style agent when back online, and shows how and why its answer changed.
- **Accessibility-first agent:** adapts how it explains (voice, simplified text, visual) to the user while keeping the same underlying reasoning trail.

Deliverable

Working agent + a short explanation of how it adapted to language/access constraints + a 3-min video.

BASIX.Market — Mature Build

Expects more finished output than 2.1 and 2.2, because it is meant to plug into a real product: the future BASIX NFT Marketplace.

In plain words: Build a working feature or module for BASIX's NFT marketplace. Treat it like product work: it should be usable, not just a proof of concept.

Challenge options (pick one)

- **Ownership:** a simple ownership / fractional-share tracking prototype.
- **Phigital:** a basic physical + digital asset listing flow.
- **Creators:** a creator-onboarding mini-tool for local artists and entrepreneurs.

Next Level Devs

For teams with prior competition experience (a previous hackathon or sprint). Has a commercial angle and a gaming angle. Judged partly on “**would a real business trust this?**”, not just “does it work?”

The Agent That Can Be Trusted With Money

Financial and business decisions need reasoning you can audit afterwards. Build an agent that makes a real (small-scope) business decision and produces an audit trail that a sceptical manager, auditor or investor could actually follow.

In plain words: A business decision agent whose output reads like a defensible memo. Handling messy or missing data gracefully is part of the test.

What raises the bar vs. beginner tracks

- Must handle at least one case of **incomplete or conflicting input data** and explain how it handled the gap.
- Must produce a justification a human reviewer could use to **override** the agent's decision.
- Judged partly on whether a real business would trust it.

Challenge options (pick one)

- **Vendor/quote comparison:** picks between 3–4 options with a reasoning chain on cost, risk and fit that a non-technical stakeholder could challenge.
- **Micro-lending / fractional-ownership approval (BASIX-flavoured):** approves or rejects a small transaction with a full justification trail and a clearly stated confidence level.
- **Pricing/discount agent:** explains line by line why it approved or rejected a specific deal.

Deliverable

Working agent + a one-page “audit trail” sample output + a 3-min video pitched as if to a real business owner.

TRACK 3.2 · GAMING

The NPC That Won't Break Character

Game NPCs eventually say something dumb because they have no real memory or reasoning. Build an NPC or game agent with persistent memory and consistent internal logic, so it treats a returning player differently from a stranger and never contradicts itself.

In plain words: Interactive fiction with a character that genuinely remembers. A simple text/chat interface is fine; no game engine needed.

What makes a strong entry

- Playable-feeling output (think interactive fiction, not a full game).
- Memory must **visibly change behaviour** in-session, not be “remembered but ignored”.
- Bonus: the NPC can be *wrong* (acting on a false rumour) in a way that feels like a feature, not a bug.

Challenge options (pick one)

- **Quest-giver NPC:** remembers what the player has done, brings it up unprompted, and refuses to repeat a quest it already gave.
- **Rival / companion:** holds a consistent opinion of the player based on past interactions and can explain why if asked.
- **“World knows about you”:** has heard rumours about the player from other characters, reacts accordingly, and can say which NPC told them what.

Deliverable

Working demo + a short “play session” transcript showing memory changing behaviour + a 3-min video with a judge or teammate playing live.

Build the AI Infrastructure Layer

Described as “not a classroom exercise”. Teams work directly in their own GitHub repo as a live MVP environment, using Omega's agent infrastructure to build real tools for universities, businesses and communities. You keep working in GitHub and submit the repo URL at the end.

Eligibility

Only open to students who have **completed a prior MeTTa track**, or have completed (or are doing) **BASIX.Market coursework**. If this is your first MeTTa event, this track is not for you.

The question: how can AI agents help universities, businesses and communities scale faster? Choose one:

- **Dev/Scale Support:** onboarding, CRM support, automation, reporting, customer service, ops, or lead-qualification tools for small businesses.
- **Fractional CTO Agent:** AI-assisted technical planning, product roadmaps, vendor evaluation, dev briefs or MVP planning.
- **RWA / Digital Asset Infrastructure:** managing, documenting or activating real-world assets, cultural IP, student projects, public art, sponsorship assets, or tokenised proof-of-value.

Participants in this track go through BASIX's business pipeline: **Assess → Onboard → Build → Submit → Review → Showcase → Continue**. The organisers track metrics such as students onboarded, teams formed, MVP workflows tested and business use cases generated, so strong projects may continue after the event.

The Omega Overnight (24 hours)

For on-campus teams staying overnight at SJIT, and **mandatory for solo hackers**. One continuous 24-hour build, one working feature. Unlike other tracks where you can choose Omega, MeTTa or both, **this one must be built on Omega**. In exchange for the harder hours, the scope is tighter: you're proving one idea, not shipping a platform.

Hard requirements

- **Built on Omega, not optional.** A visible piece of Omega's stateful, auditable-reasoning architecture must be the actual feature, not decoration.
- **AI Disclosure, mandatory.** Your README must state which AI tools you used and how (e.g. “Claude for code review and debugging”). Using AI is expected and **not** penalised; **undisclosed** use is a disqualifying integrity issue.

Challenge options (pick one)

- One agent producing an auditable decision
- One agent learning and updating a rule
- Two agents resolving one conflicting claim
- One NPC demonstrating persistent memory
- One BASIX workflow completing a defined business task

Deliverable — due 10:30 AM sharp, Oct 1

- Working GitHub repo shared with BASIX.Market
- Short README: problem, solution, technology, **plus the AI Disclosure**
- One functioning Omega feature
- A sample reasoning transcript, memory record, or audit trail
- 3-minute demo video
- A short statement of what you'd build next

Submitting & judging

The same five requirements apply to every track.

#	Requirement	Details
1	Working code repository	A GitHub repo shared with BASIX.Market.
2	Short written documentation	What it does, how it works, what's next.
3	Video, 3 minutes max	Your team explains the project, shows a demo, and says what you'd build next.
4	On time	Regular teams: 11:59 PM IST, Oct 2. 24-hr SJIT teams + solo hackers: 10:30 AM IST, Oct 1.
5	Registration	Completed on BASIX.Market with your institution declared.

General judging criteria (all tracks)

Weight	Criterion	What it rewards
30%	Technical execution	Does it actually run and do what you claim?
25%	Clarity of the 3-min video / demo	Can a judge understand the problem, solution and demo quickly?
25%	Fit to track (Omega / MeTTa / BASIX)	Is MeTTa/Omega central to the solution, and does it match your chosen challenge?
20%	Team collaboration & documentation	Clean repo, clear README, evidence everyone contributed.

Tracks 1 and 2 also list their own weightings (shown on their pages). Expect judges to use both lenses: the general criteria plus that track's emphasis, e.g. “AGI potential” for MeTTa or “sustainability impact” for Omega.

Why the video is worth 25%

Judges review repos, docs and videos after the event, and videos may be published on BeyondTheCode.ai's YouTube. A tight 3-minute video (problem in 20 seconds, live demo, reasoning trail on screen, what's next) is one of the easiest places to gain points. Every deliverable in the brief asks the video to show something *live*: a challenge, a learning moment, a play session.

How judging works for the 24-hour track

- **Oct 1, 10:30 AM - 2:00 PM IST:** BASIX and technical staff verify eligible submissions.
- **2:00 - 6:00 PM IST:** judges receive repos, documentation and videos.
- **7:30 - 9:00 PM IST:** virtual finalist presentations.
- Winners at SJIT are announced by the school the next morning.

Full schedules

All times IST.

Regular teams — Day 1, Wednesday Sept 30 (Kickoff & Build)

Time	Session	What happens
10:30–10:45 AM	Welcome & opening	Live stream opens for SJIT (live) and virtual participants incl. Kenyatta.
10:45–11:00 AM	Mentor introductions	All mentors announced, plus how and when to reach them.
11:00–11:20 AM	Track briefing	Tracks, rules, judging criteria, submission requirements.
11:20–11:30 AM	Team check-in	Rosters (3–4) confirmed; track selection locked .
11:30 AM–1:00 PM	Build Block 1	Mentors circulate; help desk open.
1:00–2:00 PM	Lunch	
2:00–3:30 PM	Build Block 2	Help desk open.
3:30–3:45 PM	Tea break	
3:45–5:15 PM	Build Block 3	Help desk open.
5:15–5:45 PM	Mentor office hours	Optional drop-in for stuck teams.
5:45–6:00 PM	Day 1 wrap-up	Recap and Day 2 preview.

Regular teams — Day 2, Thursday Oct 1 (Build & Finish Strong)

Time	Session	What happens
10:30–10:45 AM	Day 2 kickoff	Stream re-opens; mentors re-announced.
10:45 AM–12:30 PM	Build Block 4	Help desk open.
12:30–1:30 PM	Lunch	
1:30–3:00 PM	Build Block 5	Help desk open.
3:00–3:15 PM	Tea break	
3:15–4:45 PM	Build Block 6	Help desk open.
4:45–5:00 PM	Tea break	
5:00–5:45 PM	Final mentor office hours	Last guidance before on-site time ends.
5:45–6:00 PM	Closing announcement	On-campus portion ends; reminder that submission is due midnight Oct 2.

Regular teams — Friday Oct 2 (Polish, Record & Submit)

No campus sessions. Teams work remotely to finish the build, record the video, and submit repo + docs + video by **11:59 PM IST**. The help desk stays available on BASIX.Market.

24-hour track & solo hackers — Sept 30 to Oct 1

Time	What happens
Sept 30	
10:30–11:00 AM	Opening, partner welcome, hackathon purpose
11:00–11:30 AM	Tracks, rules, judging and submission briefing
11:30 AM–12:00 PM	Confirm teams and lock track
12:00–2:00 PM	Build Block 1: define problem, user and technical approach
2:00–2:45 PM	Lunch
2:45–5:30 PM	Build Block 2: set up repo and a working foundation
5:30–6:00 PM	Checkpoint 1: team lead reports progress and blockers
6:00–8:30 PM	Build Block 3: core feature development
8:30–9:15 PM	Dinner
9:15 PM–12:00 AM	Build Block 4: integration and first working demo
Oct 1	
12:00–12:30 AM	Midnight technical checkpoint
12:30–3:30 AM	Build Block 5: testing and problem-solving
3:30–4:00 AM	Break
4:00–6:30 AM	Build Block 6: complete core functionality
6:30–7:15 AM	Breakfast
7:15–8:30 AM	Documentation, repo cleanup, audit trail
8:30–9:30 AM	Record the 3-minute demo video
9:30–10:00 AM	Final upload and submission checks
10:00–10:30 AM	Closing, acknowledgements, next steps
10:30 AM	Hard submission deadline

Notice that the plan has a working demo by midnight and **stops building at 6:30 AM**. The last four hours are for docs, the video and submission. Stick to that; it's what keeps a 24-hour team from missing the deadline.

Support, filming & terms

What you'll get from the organisers, and what you agree to.

Support available	Filming & publicity
• MeTTa development resources • SingularityNET platform access • Technical mentorship (during build blocks + daily office hours) • Live help desk, continuous, also on BASIX.Market • Mentors online • iCog developers on campus • BGI Comms community	• The host and film team are live for every build block, both days. • You will be on camera at SJIT. • All team videos can and will be used on BeyondTheCode.ai's YouTube, and are seen by judges.

Terms & conditions

- **Ownership:** students keep 100% creative control; the brief describes this as a “partnership” with BASIX.Market.
- **Shared GitHub:** you must share your GitHub repo with BASIX.Market.
- **Support:** access to the BGI Comms+ help desk.
- **Technical focus:** experimental prototypes and working demonstrations.

Who's behind it

Partners, venues and the judging / host panel.

Organisation	Role
SingularityNET	Technology partner (MeTTa, Omega, Hyperon)
BASIX.Market	Host platform; NFT infrastructure
BGI Comms	Community; BGI Comms+ help desk
iCog Labs	Developers and mentors
BeyondTheCode.ai	Media & documentation (filming)
SJIT College, Chennai	Live venue
Kenyatta University of Engineering (ESA-KU)	Virtual venue
DevSphereIndia	Special guest; runs CodeSlayer 2K26
Cognitive-Sprints.in	BASIX.Market developer relations

Judges and hosts

Name	Role / organisation	Why it matters to you
Dr. Ben Goertzel	CEO & Chief Scientist, SingularityNET	AGI researcher; the MeTTa “AGI potential” angle will resonate.
Haley Lowy	Chief of Staff, SingularityNET / BGI Commons	Community and continuity beyond the event.
Rafael Presa	AI Community Strategy Manager, SingularityNET	Operations, clear processes, measurable outcomes.
Nefertiti Strong	Co-founder, CVO & COO (XRAgency, BeyondTheCode.ai, BASIX)	Filmmaker; oversees the media side. Video quality matters.
Saskia Betz	Co-founder, CEO & CMO (XRAgency, BASIX)	Strategy and security discipline.
Rosy Salutem	Chief of Staff, XRAgency & BeyondTheCode	Go-to-market and global ecosystems.
Sheila Wanjiru	Head of BD, XR Agency (virtual host)	Hosts the virtual stream.
Yeabesera Derese	Lead Developer & CTO (iCog, SingularityNET, BASIX)	Works on self-improving AI. Technical depth will be noticed.
Prateek Choudhary	Hackathon help desk	Your first contact when stuck.
Samuel Wondimagegnehu	Lead Developer, iCog Labs / SingularityNET	Neuro-symbolic AI engineer.
Surafel Fikru	Software/AI Engineer, iCog / SingularityNET	Works on the Omega projects directly.
Shiva Shukla	Head of Design, Blockwee (live host)	Hosts the live stream.
Luvai Darwajawala	Co-founder & COO, Blockwee	Startup operator; business viability lens.
Logan Golema	CEO & Founder, Heir	Long blockchain background.

The panel mixes AGI researchers, Omega engineers, business operators and filmmakers. A winning entry should be technically real, clearly useful, and well presented on video.

Things in the brief worth clarifying

The deck is a draft-style brief and a few details are inconsistent. Ask the help desk or organisers about these before Sept 30 rather than guessing.

What the brief says	Why it's unclear	What to ask
"24 HRS SJIT Campus" vs. "1 day on campus" vs. a Day 1 + Day 2 on-campus schedule (10:30 AM – 6 PM)	It's not clear whether SJIT campus teams do the 24-hr overnight format (deadline Oct 1, 10:30 AM) or the 2-day format (deadline Oct 2, 11:59 PM).	"As an SJIT team, which deadline applies to us?"
Terms slide: "2-day hackathon, 2-day intensive coding"	Other slides say 2 build days + 1 submit day.	Confirm the total number of build days.
MeTTa track says "three tracks" but lists two	A third MeTTa challenge may be missing.	"Is there a third MeTTa Foundation challenge?"
Omega slide says "All four" but lists three design rules	Minor, but a rule may be missing.	Optional.
Two Agents, One Truth has no deliverable listed	Other challenges specify one.	"What's the expected deliverable for 2.1?" Safe default: working agents + negotiation transcript + 3-min video.
BASIX Mature Build has no deliverable listed	Only examples are given.	Ask what "more finished" means in practice.
24-hr judging: finalist presentations 7:30–9:00 PM IST, "approximately 10:00–11:30 AM IST"	The two times conflict; one is probably another time zone.	Confirm finalist presentation time.
Track 4 eligibility: "completed or have BASIX.Market coursework"	Unclear if in-progress coursework counts.	Confirm if you're considering Track 4.
Omega vs MeTTa access	The brief doesn't say where to get Omega or which versions to use.	"Where are the Omega docs/repo and starter code?"

PRACTICAL

How to choose a track

If your team is...	Consider	Why
New to MeTTa, first hackathon	1.1 Glass Box or 1.2 Grows Up	Smallest scope, clear demo moment (a live "why?" or a rule diff).
Comfortable with coding, new to MeTTa	2.1 Two Agents or 2.2 Without Borders	Fun hooks; 2.2 plays well with a Tamil/Indian-language angle.
Strong on web/product dev	2.3 BASIX Mature Build	Plugs into a real product, so polish counts.
Experienced hackathon team	3.1 Money or 3.2 NPC	Higher bar but a more impressive, business-ready story.

If your team is...	Consider	Why
Done MeTTa/BASIX before	Track 4	Real MVP work that may continue after the event.
Solo	Track 5 (required)	Pick the challenge closest to what you can build alone in ~18 hours.

Prep checklist for the next 4 days

- **Register** on BASIX.Market with your institution declared.
- **Lock your team** (3-4) and agree on a first- and second-choice track.
- **Install MeTTa** and run a hello-world. Hyperon's MeTTa can be installed via pip (`pip install hyperon`); confirm the recommended setup with the organisers.
- **Ask for Omega docs/starter code** now, especially if you're doing Track 5, which must use Omega.
- **Learn the basics:** how MeTTa represents facts and rules, how to query, and how to add or change a rule at runtime (key for 1.2).
- **Set up a GitHub repo** with a README skeleton: Problem · Solution · How it works · Tech used · AI Disclosure · What's next.
- **Split roles:** MeTTa logic, interface (a simple CLI or web chat is fine), docs, and video/demo owner.
- **Draft your one-line pitch** and the 3-minute video outline before you write code.
- **Pick a demo scenario** with real, specific data (e.g. a Chennai campus helper, a scholarship-allocation case).
- **Plan to finish early.** Aim for a working version by the end of Day 1 and use Day 2 for depth and robustness.

A 3-minute video structure that works

Time	Content
0:00-0:20	The problem, in one or two sentences. Who has it?
0:20-0:40	Your one-line pitch and chosen track.
0:40-2:10	Live demo. Show the key behaviour: the reasoning trail, the rule diff, the memory changing behaviour.
2:10-2:40	How it works: a quick look at the MeTTa rules / Omega architecture.
2:40-3:00	What you'd build next; team credits.

Bottom line: pick a narrow challenge, make MeTTa/Omega the heart of it, get it running by the end of Day 1, make the reasoning visible on screen, and treat the 3-minute video as a quarter of your grade.
